

Keshmesh Abbasi

Keshmesh Abasi Company has been active as one of the reputable producers and suppliers of various types of raisins in Iran for many years. This company was established with the aim of providing high-quality and natural products to both domestic and foreign markets, and by utilizing technical knowledge and experience, it has managed to achieve a special position in the dried fruit industry.

Raisin is the ripe and dried fruit of m5.

O grape varieties (*Vitis Vinifera L.*) from the Vitaceae family, from which a significant amount of moisture is removed to increase its shelf life and usability for other applications. Raisins are generally classified into seedless and seeded raisins. Based on the type of grape, the method and conditions of drying, and permissible additives, raisins are categorized into sun-dried raisins, lye-treated raisins, grape raisins, and green raisins.

Seedless Raisins . Seeded Raisins

This type of raisin is obtained from the drying and processing of seedless grapes. Seedless raisins have very small and imperceptible seeds that cannot be easily felt by the pressure of fingers. The color of seedless raisins varies based on the drying method, ranging from dark brown to amber yellow. Seedless raisins are categorized by size into large, medium, and small.

This type of raisin is obtained from the drying of seeded grapes, where the seeds can be felt and distinguished by the pressure of fingers.

Green Raisins

These are the dried and ripe fruit of grape varieties, with the drying process occurring in the shade, resulting in a green or golden-green color. This type of raisin is primarily produced in the Kashmar region of Iran, so it is also called Kashmari raisin. The mentioned grape varieties can be either seedless or seeded. The seeds in green raisins refer to small and relatively soft seeds that can be felt when eaten, and it should be noted that hard seeds found in seeded raisins or dried grapes are not considered.

Tizabi Raisins (Sultana)

These are the ripe fruits of various grape varieties that have been coated with an approved alkaline solution and dried in sunlight. The color of this type of raisin varies from light yellow to brownish. To reduce the drying time of grapes, lye treatment is used with cold, warm, or emulsified lye solutions by immersion or spraying methods. Lye treatment of grapes is performed to improve product quality, fruit clarity, and to preserve its color, flavor, and essences. The presence of green oil in lye treatment helps fill the gaps and pores of the grape skin and prevents microorganisms and fungal spores from penetrating the grape fruit, thus preventing spoilage.
